Scalability and future plan

User Authentication: Implement a secure login system for employees and managers.

Travel Request Form: Design a form for employees to submit travel requests including details like destination, purpose, dates, budget, etc.

Approval Workflow: Set up an approval process where managers can review and approve/deny travel requests.

Notification System: Implement notifications to keep employees informed about the status of their requests.

Reporting and Analytics: Develop reporting tools to track travel expenses, analyze trends, and optimize costs.

For scalability and future plans, consider these aspects:

Scalable Infrastructure: Design the application with scalability in mind, allowing it to handle increased user loads as the company grows.

Mobile Compatibility: Develop a mobile-friendly version or app for on-the-go access.

Integration Capabilities: Ensure the application can integrate with other corporate systems like HR software or accounting tools.

Data Security: Prioritize data security measures to protect sensitive employee and company information.

Feedback Mechanism: Incorporate a feedback loop for users to suggest improvements and features, allowing the application to evolve based on user needs.

Building such an application involves a mix of technical development, user experience design, and ongoing refinement to adapt to changing business needs and technology advancements
